

Transfection of HEK125.3 cells with Asp2-1 or Asp2-2 antisense oligomers reduces production of the CTF β -secretase product in comparison to cells similarly transfected with control oligomers having the reverse sequence (Asp2-1 reverse & Asp2-2 reverse)

In cotransfection experiments, cotransfection of Hu-Asp2 into mouse Neuro-2a cells with the APP-KK construct increased the formation of CTF99. This was further increased if Hu-Asp2 was coexpressed with APP-Sw-KK, a mutant form of APP containing the Swedish KM \rightarrow NL mutation that increases β -secretase processing.

Cotransfection of Hu-Asp2 with APP has little effect on A β 40 production but increases A β 42 production above background (Table 4). Addition of the di-lysine motif to the C-terminus of APP increases A β peptide processing about two fold, although A β 40 and A β 42 production remain quite low (352 pg/ml and 21 pg/ml, respectively). Cotransfection of Asp2 with APP-KK further increases both A β 40 and A β 42 production. The stimulation of A β 40 production by Hu-Asp2 is more than 3 fold, while production of A β 42 increases by more than 10 fold. Thus, cotransfection of Hu-Asp2 and APP-KK constructs preferentially increases A β 42 production.

The APP V717 \rightarrow F mutation has been shown to increase γ -secretase processing at the A β 42 cleavage site. Cotransfection of Hu-Asp2 with the APP-VF or APP-VF-KK constructs increased A β 42 production (a two fold increase with APP-VF and a four-fold increase with APP-VF-KK, Table 4), but had mixed effects on A β 40 production (a slight decrease with APP-VF, and a two fold increase with APP-VF-KK in comparison to the pcDNA cotransfection control). Thus, the effect of Asp2 on A β 42 production was proportionately greater leading to an increase in the ratio of A β 42/total A β . Indeed, the ratio of A β 42/total A β reaches a very high value of 42% in HEK293 cells cotransfected with Hu-Asp2 and APP-VF-KK.

Western blot showing reduction of CTF99 production by HEK125.3 cells transfected with antisense oligomers targeting the Hu-Asp2 mRNA. (right) Western blot showing increase in CTF99 production in mouse Neuro-2a cells cotransfected with Hu-Asp2 and APP-KK. A further increase in CTF99 production is seen in cells cotransfected with Hu-Asp2 and APP-Sw-KK.

Table 4. Results of cotransfecting Hu-Asp2 or pcDNA plasmid DNA with various APP constructs containing the V717→F mutation that modifies γ -secretase processing. Cotransfection with Asp2 consistently increases the ratio of A β 42/total A β . Values tabulated are A β peptide pg/ml.

	pcDNA Cotransfection			Asp2 Cotransfection		
	A β 40	A β 42	A β 42/Total	A β 40	A β 42	A β 42/Total
APP	192 \pm 18	<4	<2%	188 \pm 40	8 \pm 10	3.9%
APP-VF	118 \pm 15	15 \pm 19	11.5%	85 \pm 7	24 \pm 12	22.4%
APP-KK	352 \pm 24	7 \pm 6	5.5%	1062 \pm 101	226 \pm 49	17.5%
APP-VF-KK	230 \pm 31	88 \pm 24	27.7%	491 \pm 35	355 \pm 36	42%

Example 9. Bacterial expression of human Asp2L

Expression of recombinant Hu-Asp2L in E. coli.

Hu-Asp2L can be expressed in E. coli after addition of N-terminal sequences such as a T7 tag (SEQ ID No. 21 and No. 22) or a T7 tag followed by a caspase 8 leader sequence (SEQ ID No. 23 and No. 24). Alternatively, reduction of the GC content of the 5' sequence by site directed mutagenesis can be used to increase the yield of Hu-Asp2 (SEQ ID No. 25 and No. 26). In addition, Asp2 can be engineered with a proteolytic cleavage site (SEQ ID No. 27 and No. 28). To produce a soluble protein after expression and refolding, deletion of the transmembrane domain and cytoplasmic tail, or deletion of the membrane proximal region, transmembrane domain, and cytoplasmic tail is preferred.

Methods

PCR with primers containing appropriate linker sequences was used to assemble fusions of Asp2 coding sequence with N-terminal sequence modifications including a T7 tag (SEQ ID Nos. 21 and 22) or a T7-caspase 8 leader (SEQ ID Nos. 23 and 24). These constructs were cloned into the expression vector pET23a(+) (Novagen) in which a T7 promoter directs expression of a T7 tag preceding a sequence of multiple cloning sites. To clone Hu-Asp2 sequences behind the T7 leader of pET23a+, the following oligonucleotides were used for amplification of the selected Hu-Asp2 sequence:

#553=GTGGATCCACCAGCACGGCATCCGGCTG (SEQ ID No. 35),

#554=GAAAGCTTTCATGACTCATCTGTCTGTGGAATGTTG (SEQ ID No. 36) which placed BamHI and HindIII sites flanking the 5' and 3' ends of the insert, respectively. The Asp2 sequence was amplified from the full length Asp2(b) cDNA cloned into pCDNA3.1 using the Advantage-GC cDNA PCR (Clontech) following the manufacturer's supplied protocol using annealing & extension at 68°C in a two-step PCR cycle for 25 cycles. The insert and vector were cut with BamHI and HindIII, purified by electrophoresis through an agarose gel, then ligated using the Rapid DNA Ligation kit (Boehringer Mannheim). The ligation reaction was used to transform the E. coli strain JM109 (Promega) and colonies were picked for the purification of plasmid (Qiagen, QiaPrep minispin) and DNA sequence analysis. For inducible expression using induction with isopropyl β-D-

thiogalactopyranoside (IPTG), the expression vector was transferred into E. coli strain BL21 (Stratagene). Bacterial cultures were grown in LB broth in the presence of ampicillin at 100 µg/ml, and induced in log phase growth at an OD₆₀₀ of 0.6-1.0 with 1 mM IPTG for 4 hour at 37°C. The cell pellet was harvested by centrifugation.

To clone Hu-Asp2 sequences behind the T7 tag and caspase leader (SEQ ID Nos. 23 and 24), the construct created above containing the T7-Hu-Asp2 sequence (SEQ ID Nos. 21 and 22) was opened at the BamHI site, and then the phosphorylated caspase 8 leader oligonucleotides #559=GATCGATGACTATCTCTGACTCTCCGCGTGAACAGGACG (SEQ ID No. 37), #560=GATCCGTCCTGTTACGCGGAGAGTCAGAGATAGTCATC (SEQ ID No. 38) were annealed and ligated to the vector DNA. The 5' overhang for each set of oligonucleotides was designed such that it allowed ligation into the BamHI site but not subsequent digestion with BamHI. The ligation reaction was transformed into JM109 as above for analysis of protein expression after transfer to E. coli strain BL21.
